Description of the degree program

Quantum Technologies in Electrical and Computer Engineering (Master)

PO 1

Date: 22.03.2024

Table of contents

ECTS	120

ECTS	15

Title	Ambits of Electromagnetic Field Theory		
Number	2419110	**Module version**	
Shorttext	ET-IEMV-11	**Language**	english
Frequency of offer	only in summer term	**Teaching unit**	Fakultät für Elektrotechnik, Informationstechnik, Physik
Module duration	1	**Institution**	Institut für Elektromagnetische Verträglichkeit
Hours per Week / ECTS	4 / 5,0	**Module owner**	Achim Enders
Workload (h)	150		
Class attendance (h)	56	**Self studying (h)**	94
Compulsory requirements			
Recommended requirements			
Expected performance/ Type of examination	Written exam (120 min) or oral exam (30 min)		
Course achievement			
Module grade composition			

Contents

- Energetic considerations, Poynting theorem, equivalent circuit
- Potentials in the dynamic case, Hertzian dipole and radiation, approximations for the field descriptions
- Analytical calculation methods and examples, numerical field calculation

Objective qualification

The students can explain the structure of the Maxwell equations in differential form, herefrom derive the fully dynamic field solution of the Hertzian dipole and, depending on the special case, give reasons for idealized approximate solutions. By this they can analyze fundamental electrotechnical configurations and abstract to the essential details. They can choose and apply appropriate solution methods for example for energetic problems, Poynting theorem and temporal and spatial variable fields.

Contents

• QBits: concept and different realizations
• Bloch-Sphere and Q-Sphere
• Basic quantum logic gates: CNOT, Hadamard, …
• Combinations of quantum logic gates and their applications
• Quantum Information and Quantum Communications
• Quantum Cryptography and Quantum Key Distribution
• Quantum Walks and Search Algorithms
• Quantum Simulation
• Quantum Error Correction

Objective qualification

The students can describe different realizations of qbits and can visualize them using the Bloch sphere or the Q-Sphere, respectively. They can apply basic quantum logic gates to form basic applications of qbits (Bell states and others). They can describe basic and advanced models of quantum information processing, transmission, and computing systems. They know the important quantum effects including teleportation, super-dense coding, and no-cloning theorem and can relate them to the quantum algorithms.
From quantum communications, the students know the fundamental results on capacities of quantum-assisted classical, classical-quantum, and pure quantum channels. The students know the current state of the art of multi-user quantum channels and the available rate characterizations.
From quantum computing, the students learn about circuits and operations on qubits and the elements of quantum algorithms, such as Shor's algorithm, Grover's algorithm, and quantum random walks. They also understand the corresponding aspects of runtime (lower and upper bounds) and the relation to classical algorithms. The students can present their work to a non-professional audience.

Contents

- Basics of linear optics
- 2nd order nonlinear optical effects
- 3rd order nonlinear optical effects
- Nonlinear scattering
- Optical telecommunications
- Nonlinear effects in optical fibers
- Suppression of nonlinear effects
- Applications of nonlinear effects

Objective qualification

After a successful participation, the students know the main basics of nonlinear photonics and will be able to use them for the evaluation of optical systems and optical data transmission systems.

Literature

Contents

Objective qualification

The participants can describe basic phenomena of light propagation (reflection, scattering, absorption, transmission) at interfaces and in homogeneous media qualitatively and quantitatively.
Participants can name important basic elements of nanooptics, such as waveguides, optical gratings, photonic crystals or metamaterials, discuss their properties qualitatively and name fields of application.
Participants are able to identify the basic elements in complex optical systems and describe their respective functions.
The participants can name important processes of micro- and nanostructuring and explain how they work.
The participants can solve the wave equation in simple dielectric, metallic and hybrid nanooptical systems analytically and semi-analytically and interpret the solutions.
Participants can classify optical resonance phenomena in nanooptical systems and name their essential properties.

Contents

- physical and chemical basics
- manufacturing of single crystals and wafers
- epitaxial crystal growth processes and crystal defects
- doping processes
- semiconductor measurement technology
- planar technology
- basics of photolithography, deposition processes for dielectrics and etching processes

Objective qualification

After completing the semiconductor technology module, students have:

- an understanding of the basic manufacturing technologies of semiconductors as well as components and integrated circuits made from them.
- the ability to recognize the principles of the most modern manufacturing processes in semiconductor technology and their modes of operation
- the ability to analyze and extrapolate trends in semiconductor technology developments

Contents

Introduction to molecular electronics
basic considerations (molecular orbitals, conjugated systems)
characterisation tools
transport mechanisms
conductive polymers
optoelectronic applications of molecular systems

Objective qualification

Students are familiar with the fundamentals of organic chemistry. They can explain the structure of molecular orbitals and describe the different hybridization states of carbon atoms in the context of LCAO. They analyze the electron transfer between different molecules in the framework of the Marcus theory and can describe the essential aspects of electronic tunneling processes. They understand the content of current research publications and present them in short presentations. They can describe the structure of conductive polymers, their doping and electronic transport. They analyze the optoelectronic properties of polymers and organic dyes and can classify and explain the relevant electronic excitations and processes.

- Semicondustor materials for quantum structure devices
- Electronical quantum well devices
- Emission and absorption (Einstein relations, Fermi´s golden rule, electron photon interaction)
- Excitons
- Photonic quantum well devices
- Quantum wire and quantum box, one and zero dimensional electronic structures
- Semiconductor devices based on one and zero dimensional quantum strutures
- Tunneling, tunnel diode, resonant tunnel diode

Objective qualification

After completion of the module students have deeper understanding of quantummechanical phenomena in semiconductor devices. They have the ability to design and dimension quantum structures.

Contents

Descriptive and comparative statistics, significance tests, outlier tests, application of important probability distributions (normal distribution, Student#s t-distribution, F distribution). Fundamentals of design of experiments and analysis, statistical analysis of obtained factors and models. Introduction to the matrix version of least squares. System optimization with respect to simple and multiple targets. For all modules (I # III): use of free (for academic purposes) state-of-the-art statistical software R and associated integrated programming environment RStudio.

Objective qualification

Overarching target is to familiarize participants with statistical principles of data analysis, comparison of and inference from experimental data (part I - Statistics), the optimal design of experiments (part II - Design of Experiments), and system optimization (part III - Optimization). Participants will learn to use the state-of-the-art statistical software R and apply the content of the lecture to optimize multi-parameter problems typically encountered in an industrial setting. After attending the course participants will be able to analyze experimental data according to established statistical procedures (test for outliers, confidence intervals for a single response and differences between observations of pairs of responses, evaluation and planning of sample sizes). Part II # Design of Experiments # enables the participants to plan experiments for maximal efficiency and analyze the reliability of the parameters extracted from the data (determination and understanding of the relevance of process variances, confidence intervals and significance of extracted process parameters). Participants furthermore will be skilled in using least-squares methods applied to data analysis and model building. During part III # Optimization # participants will learn to optimize multidimensional systems which include interaction between the controlling factors and multiple, possibly conflicting targets.

Contents

- Terms and definitions of EMC
- Sources of interference and disturbance variables, immunity of susceptible devices
- Coupling mechanisms: galvanic, capacitive, inductive coupling, wave and radiation interference
- Establishing of EMC by measures at the sources of interference, at the coupling paths and at the susceptible devices; shielding, overvoltage and overcurrent protection
- Legal basis, product liability, standardization
- EMC test engineering
- Electromagnetic compatibility of biological systems
- Current EMC issues presented in seminar talks

Objective qualification

The students are able to analyze mutual interference and interaction scenarios for electrotechnical and electronic systems and components by emitted interference levels and susceptibilities. The students are able to choose appropriate protection and compatibility measures. The students are able to predict EMC-aspects for the design of facilities and systems at an early stage, as well as to decide on cost-efficient solutions. The students are able to describe the responsibilities for the EMC product safety by the state of standards. The students are able to assess the EMC product safety by failure mechanisms. The students are able to investigate current EMC issues autonomously, structure and present them to an audience.

- Basics of Quantum Mechanics
- From Bit to Qubit
- Quantum Circuits I
- Quantum Circuits II
- Entanglement and Teleportation
- Algorithms of Quantum Computing
- Quantum Hardware I
- Quantum Hardware II

Objective qualification

- The students can name the prerequisites for the realization of qubits as well as typical platforms and explain their significance.
- Students will be able to name the strengths and weaknesses of different hardware platforms in common application scenarios and weigh them against each other.
- The students can name the essential process steps for the realization of different quantum computer platforms and to explain challenges that may arise in the manufacturing process.
- Students will be able to use an exemplary platform to explain how selected quantum gates can be realized.

Contents

- superconductivity
- spintronics
- low temperature
- realization of qubits
- charge and spin transport

Objective qualification

The students learn and know the fundamentals in quantum physics for the realization of qubits. They transfer the physical
concepts of superconductivity and spintronics into the context of ‘quantum computing’. They learn possible structuration
methods to represent qubits in real systems and can implement experimental techniques, e. g., charge and spin transport
at low temperature.

Literature

Remark

Students either have to choose "Superconductivity" or "Physical Fundamentals of Spintronics" (lecture + exercise).

Contents

Foundations of magnetism
Foundations of magnetic quantum systems
Experimental methods to characterize magnetic quantum systems
Isolated quantum systems and the influence of the environment
Experimental realizations of magnetic quantum systems
Optimization of the properties of magnetic quantum systems
Applications of magnetic quantum systems

Objective qualification

The students comprehend the quantum mechanical foundations of magnetism. They know the theoretical models to describe them and can calculate their static and dynamic properties. The students know the experimental methods to study the properties of magnetic quantum systems as well as the fundamental prerequisites for such studies. They can theoretically describe the fundamental influence of the environment on the properties of magnetic quantum systems. They also know how this can be used to tailor their properties in the desired manner. The students are aware of the most important realizations of magnetic quantum systems, like molecular magnets and defect centers in diamond and have first insights into the current state of research in those areas. They also know some of the applications that magnetic quantum systems are used for. For specific topics on current research they will elaborate seminar presentations with literature research that they will present in a short talk.

Contents

- Basics from probability theory
  - Event, probability, random variable, random vector, stochastic process, convergence of random series, convergence theorems
- Basics from information theory
  - Measures for discrete random varaibles: entropy, conditional entropy, relativ entropy, mutual information, conditional mutual information, inequalities
  - Measures for continous random variables: differential entropy, conditional differential entropy, relative entropy, mutual information, inequalities
  - Measure for random series
  - Typical sequences and asymptotic equipartition property
- Source and source coding
  - Definition and properties
  - Source coding for discrete memoryless sources (fixed and variable-length)
  - Selected source codes: Morse, Huffman, Shannon-Fano-Elias
- Data transmission and channel capacity
  - Discrete memoryless channel: channel coding theorem
  - Discrete memoryless channel with state: channel capacities
  - Gaussian channel: model and channel coding theorem
  - Bandlimited Gaussian channel, vector valued channels

Objective qualification

The lecture provides an introduction to the fundamentals of Shannon information theory. The goal is that students can derive the main information theoretic results on maximal achievable lossless (source coding) and lossy (rate distortion theory) compression of data and on maximum data rates for reliable data transmission (channel coding). The methods and tools required, e.g., information measures (entropy, mutual information, capacity etc.) and their properties (typical sequences) will be covered as well as practical applicable simple codes (block, turbo and polar codes).

Contents

- Review point-to-point channel capacity and coding theorem
- Strong typical sequences and their properties
- Multiple-Access Channel: Capacity region compared to TDMA/FDMA/SDMA/NOMA
- #Broadcast Channel: degraded BC capacity region, non-degraded BC achievable rate region and converse
- Interference Channel: very strong, strong, weak interference capacity region, medium interference achievable rate region and converse
- #Relay Channel: achievable schemes amplify-and-forward, decode-and-forward, compress-and-forward, estimate-and-forward #Generalization and application of elements to complex networks

Objective qualification

After completing the lecture, the students will know the building blocks of complex communications networks, i.e., the multiple-access channel, the broadcast channel, the relay channel and the interference channel, their achievable rates and capacity regions including coding and decoding schemes. In addition, the students obtain knowledge to design future wireless and multi-hop as well as ad-hoc networks. They master information-theoretic and mathematical tools to prove coding theorems. They know the state of the art as well as open problems in network information theory.

Contents

Axioms of quantum mechanics, Hilbert space, quantum states
Quantum logic gates and their mathematical representations
Indistinguishable particles, bosons and fermions
Concept of quantum entanglement, EPR paradox, Schmidt decomposition
Bell inequalities: What they are, what they are for and experimental violations
Measurements of entanglement: entropy, concurrence for pure and mixed-states
Quantum teleportation, The no cloning theorem
Shannon’s information theory
Super dense coding and its protocols, Quantum error corrections
Basics of topological quantum

Objective qualification

The students will learn the basics and mathematical descriptions of quantum entanglement both for pure and mixed quantum mechanical states. They will investigate the measures of entanglement and will apply them to particular (two- and many-particle) examples. By making use of the concept of entanglement and of quantum logical gates, the students will learn how to develop and apply quantum teleportation, cryptography and computation protocols.

Contents

- Introduction to the basic concepts of quantum mechanics and quantum systems
- Introduction to quantum information theory
- Protocols for quantum computation and programming
- Introduction to quantum communication networks
- Capacity calculations for entanglement-assisted communication
- Introduction to communication with the help of quantum repeaters

Objective qualification

The students
- know the basics of quantum communication networks
- understand quantum information theory models
- can calculate rate limits of quantum information-theoretical networks
- understand simple protocols for quantum communication networks
- can simulate simple protocols for quantum communication networks
- can independently develop their own protocols for new models

Contents

individual; requirements according to internship guidelines

Objective qualification

The industrial internship provides in-depth preparation for professional life by working directly in an industrial company for at least 10 weeks. Students gain insight into organisational and operational processes and structures as well as into the work methods of engineering activities in industrial companies. Within the wide variety and breadth of structural areas (e.g. research, development, production, sales,...) and fields of activity (e.g. hardware or software development, production planning, quality assurance, sales, (project) management,...) in an industrial company, an exemplary selection with in-depth familiarisation with one or a few of these areas or fields is expected.
The aim of the module is the further development of action patterns and techniques appropriate to the situation and task as well as the further development and adaptation of the methodological skills taught during the course in the engineering solution of technical problems. In addition, students deepen their interdisciplinary knowledge and skills (e.g. discussion and negotiation skills, presentation techniques, documentation, etc.), for example by participating in meetings or by being involved in conceptual, planning or management tasks. They also carry out their own engineering activities (e.g. in conceptual planning, development or quality assurance) independently and represent their own interests. In doing so, they apply the technical knowledge and skills acquired during their studies to practical tasks in an industrial environment.
The activities carried out as part of the industrial internship must be presented in an ungraded presentation. The presentation, including preparation and follow-up work, is worth 3 credits within the 12 credits of this module.

Literature

Remark

The activities carried out as part of the industrial internship must be presented in an ungraded presentation. The presentation, including preparation and follow-up work, is worth 3 credits within the 12 credits of this module. The workload is exclusively at the location of the industrial partner, usually outside the university.

individual

Objective qualification

Key qualifications will be achieved in the following fields:

- Action-oriented courses, scientific cultures
For this purpose, courses from the overall program (pool) of interdisciplinary courses at the Technische Universität Braunschweig are to be selected. The type of examination or coursework and the number of credit points will be announced individually for each module.
https://www.tu-braunschweig.de/studium-lehre/im-studium/lehrveranstaltungen
The Dean of Studies ensures that a list of available courses is published each semester, in which recommendations for particularly practice-oriented courses are given.

- Seminar lecture
Seminar presentation at one of the institutes of the EITP faculty involved in the degree program. An independent examination of a topic with the inclusion and evaluation of relevant literature as well as the presentation and communication of the results in an oral presentation and in a subsequent discussion.

Class attendance (h)	160	**Self studying (h)**	80
Compulsory requirements			
Recommended requirements			
Expected performance/ Type of examination			
Course achievement	The Master's team project corresponds to the examination requirements of the draft (§ 9 APO). A written project plan must be submitted for the Master's team project at the beginning, which is to be updated during the course of the project. The comparison between initial planning and actual progress must be presented and justified in the final report. The results of the Master's team project must be summarized in a report in which the individual contributions of the project participants are identified. Furthermore, the results must be presented in a presentation (§ 9 APO).		
Module grade composition			

Contents
individual
Objective qualification
The Master's team project is generally completed in groups of at least three students who carry out the design, analysis, construction or simulation of an electrical or information technology system using an overarching topic as an example.

Compulsory requirements			
Recommended requirements			
Expected performance/ Type of examination	• Preparation of the Master's thesis (28 credits) • Presentation (according to § 4 para. 14 BPO) (2 credits) The assessment of the presentation is included in the overall grade of the final module with double weighting.		
Course achievement			
Module grade composition			

Contents

individual

Objective qualification

With the successful completion of the final thesis (§ 14 APO) and the presentation, the student demonstrates that he/she is able to work independently on a problem from the chosen subject area using scientific methods within a specified period of time. The qualification objectives of the degree program (Annex 1, § 2 APO) are reflected in the implementation and results of the final thesis with regard to the following components:

- Independent familiarisation with and scientific methodical processing of a topic fundamentally relevant to further development and research in the field of electrical engineering
- Literature research and presentation of the state of the art
- Development of new solution approaches for a scientific problem
- Presentation of the approach and results in the form of a paper
- Presentation of the main results in a comprehensible form
- Consolidation and refinement of key qualifications: management of an own project, presentation techniques and rhetorical skills

Literature

Remark

The Master's thesis is credited with 28 credits and the presentation with 2 credits; the assessment of the presentation is included in the overall grade of the final module with double weighting.
